Experience Summary

- Working as Server Administrator and Devops Engineer in **Absolin Software Solutions LLP**.
- Having 2+ years of experience in IT, specialize in server administration and DevOps practices, focusing on Linux and Databases optimization. My expertise includes developing RESTful APIs and leveraging Node.js frameworks such as Express.js. having a good knowladge on Linux Server Administrator, Devops, AWS.
- My technical skills include linux server administration, DevOps, AWS, EKS (Elastic Kubernetes Service), VPC (Virtual Private Cloud), Docker, Jenkins, and automating CI/CD pipelines. I am also well-versed in Agile methodologies and thrive in collaborative, dynamic team environments. Known for my proactive self-learning attitude and sense of responsibility, I am dedicated to driving effective and efficient IT solutions.
- Deployed and configured an Amazon EKS (Elastic Kubernetes Service) cluster using Infrastructure as Code (IaC) principles with Terraform, demonstrating proficiency in cloud-native technologies and automation.

Skills

- **Cloud Technologies** : AWS
- **Backend** : Node Js
- **Containerization** : Docker
- **Orchestration** : Kubernetes
- **Version control tools** : Git, GitHub
- **CI/CD** : Jenkins
- **Scripting** : Shell Scripting
- **Web Servers** : Nginx, Apache Tomcat
- **Servers** : Linux, Windows IIS
- **Operating Systems** : Windows XP/7/8/10/11, Unix/Linux
- **Database** : Mongodb, Postgres

Achievements, Labs & Certification

- Advent of Cyber in 2020 from TryHackMe Academy, won a Raspberry Pi 400 as part of the Advent of Cyber challenge
- CEH (Certified Ethical Hacking) certification in 2021 from OneByteLabs
- Advent of Cyber 3 in 2021 from TryHackMe Academy
- Advent of Cyber 2023 from TryHackMe Academy
- TryHackMe cybersecurity certifications achieved in 2021-2023, including :
  - Web Fundamentals, Introduction to Cyber Security, Jr. Penetration Tester, Pre Security, Cyber Defense, Complete Beginner, Offensive Pentesting, CompTIA Pentest+

Education

- I completed a B.Sc. in Computer Science (MPCS) from Adarsh Degree College, Andhra University, graduating in 2021.
- I successfully completed the MPC (Mathematics, Physics, Chemistry) course in intermediate at Sri Chaitanya Junior College

Projects

Project #1 : Automation

Title : ***Automate dev environment***

Description : **Vamaa Dairy Private Limited, known by the brand name Gaia Fresh, is a dairy firm headquartered in Chhattisgarh, India. They take pleasure in supplying high-quality, pure dairy products straight from farm to consumer. They provide a wide range of dairy goods like as milk, curd, ghee, paneer, lassi, chaas, and sweets. The company appears to be committed to supporting local farmers and communities.**

Roles & Responsibilities :

- **Designed and Deployed Kubernetes Cluster: Architected and implemented a Kubernetes cluster on Azure Cloud and AWS to streamline containerized application management and scalability.**
- **Automated CI/CD Pipeline: Developed and automated a Jenkins-based CI/CD pipeline to enhance deployment efficiency and consistency, reducing manual intervention and accelerating release cycles.**
- **Database Deployment and Management: Deployed and configured PostgreSQL databases, ensuring reliable data storage solutions. Conducted performance tuning and optimization to enhance database efficiency and responsiveness.**
- **Container Orchestration: Enhanced container orchestration strategies with advanced Kubernetes features such as Helm charts, custom controllers, and Operators.**
- **Application Performance Monitoring: Implemented APM tools like Datadog to monitor application performance, identify bottlenecks, and optimize code for better user experiences.**
- **Resource Scaling: Automated scaling policies for both vertical and horizontal scaling of applications and infrastructure based on demand and performance metrics.**
- **Managed and maintained Kubernetes cluster, ensuring high availability and scalability for containerized applicatioons. Implemented rolling updates and automatic scaling to accommodate increased workloads during peak useage peroids.**

Project #2 : Verification process

Title : ***Report Automation***

Description : **The DataFlow Group is a pioneering global provider of specialized Primary Source Verification (PSV) solutions, and background screening and immigration compliance services that assist public and private organizations in mitigating risks to make informed, cost-effective decisions regarding their applicants and registrants. They are partners with clients across the public and private sectors to assist them in mitigating potential risks by exposing fraudulent education degrees, job histories, practice licenses, work permits and passports, among other personal or professional documents.**

Client : DataFlow

Roles & Responsibilities :

- **Deploying Java application JAR code on Linux servers, setting up environments for JAR and WAR applications using technologies such as Git, Apache Tomcat Server, and Shell Scripting**
- **Creating a shell script to automate the scheduling of jobs and cleanup activities.**

Project #3 : RCE vulnerability

Title : ***Ultr0nctf***

Description : **This CTF (Capture the Flag) challenge focuses on Remote Code Execution (RCE) vulnerabilities within a containerized environment and incorporates the use of Docker containerization and Nginx reverse proxy. Participants will engage in practical tasks and puzzles designed to enhance their understanding of RCE vulnerabilities and their exploitation. By simulating real-world scenarios, participants will gain hands-on experience in identifying and mitigating RCE vulnerabilities in Docker containers while also learning about the role of Nginx reverse proxy in securing applications.**

Client : TryHackMe

Roles & Responsibilities :

- **Developing build deployment using Nginx reverse proxy, Node.js, Docker, and an application while setting up the environment for automation processes. Fully handling build and deployment using Git and Docker.**
- **Set up Node.js and Dockerize the application using a Dockerfile for containerization.**
- **Utilize Nginx as a reverse proxy to handle incoming requests and forward them to the backend server.**
- **Automate the build and deployment process using Git integration and CI/CD tools like Jenkins or GitHub Actions.**

Declaration

I, hereby, declare that the information given above is true to the best of my knowledge and belief.
